FYP System | Software Requirements Specification

Group 3 • Milestone 2 • UNILAK

SIBOMANA ENOCK — M05578/2026 | Jackson D. SAM — M05283/2026

1. Purpose and scope

The system will give each student and assigned supervisor a shared record of chapter submissions, review decisions and software progress. The requirements build on the five candidate pain points in Milestone 1.

In scope. One department pilot. Assigned student–supervisor pairs, chapter uploads and revisions, version-specific feedback, review status and GitHub commit or pull request links.

Outside the pilot. Supervisor allocation workflows, live chat, grading, plagiarism checks, editing chapters in the browser and automatic GitHub synchronisation.

2. Users and operating environment

Final-year students submit thesis chapters and report software progress. Assigned supervisors review versions and return corrections. Both roles use a mobile or desktop browser with internet access.

The pilot uses preconfigured accounts and assignments. Each chapter starts as Submitted. The assigned supervisor can mark the latest Submitted version Changes requested or Reviewed. Only Changes requested permits a revision. A revision creates a new Submitted version and preserves earlier files, decisions and comments. A Reviewed version ends this pilot workflow.

GitHub permissions remain in GitHub. The student must ensure that the supervisor has access to any private repository before sharing its commit or pull request link.

Evidence status

The Milestone 1 scenarios illustrate possible problems. Two actual user reviews are pending.

3. Functional requirements

ID	The system shall…	Priority	Source
FR-01	Accept a pdf or docx up to 10 mb for a named chapter and create version 1 with status submitted.	Must	PP-01
FR-02	Show the latest chapter version first and retain earlier versions in its history.	Must	PP-02
FR-03	Let the assigned supervisor add written feedback to the latest submitted version and choose changes requested or reviewed.	Must	PP-03
FR-04	Accept a revised file only after changes requested and create the next version as submitted.	Must	PP-02
FR-05	Show the owner the latest chapter status, last review time when present and feedback for each version.	Must	PP-04
FR-06	Accept a github commit or pull request url with a short summary and show it to the assigned supervisor.	Must	PP-05
FR-07	Let the assigned supervisor attach written feedback to a specific github update.	Should	PP-05
FR-08	Filter the student’s chapter list by the latest review status.	Could	PP-04

4. Non-functional requirements

ID	Category	Measurable criterion
NFR-01	Access control	Unauthenticated or unrelated users receive no project data and cannot download files or modify reviews. Verify using direct URL and request tests.
NFR-02	Privacy	All chapter downloads require an authorised project session. Verify that no file has a public download URL and the project never stores GitHub credentials.
NFR-03	Performance	At least 48 of 50 project overview requests complete within 2 seconds with 100 seeded projects and five concurrent test users, excluding file uploads.
NFR-04	Usability	Two first-time student testers each upload a chapter and locate its review status within 3 minutes, without help.
NFR-05	Accessibility	Every core control is reachable by keyboard, focus is visible, and normal text has a contrast ratio of at least 4.5:1.
NFR-06	Availability	At least 99% of scheduled five-minute checks of the pilot login page succeed during a seven-day observation window.

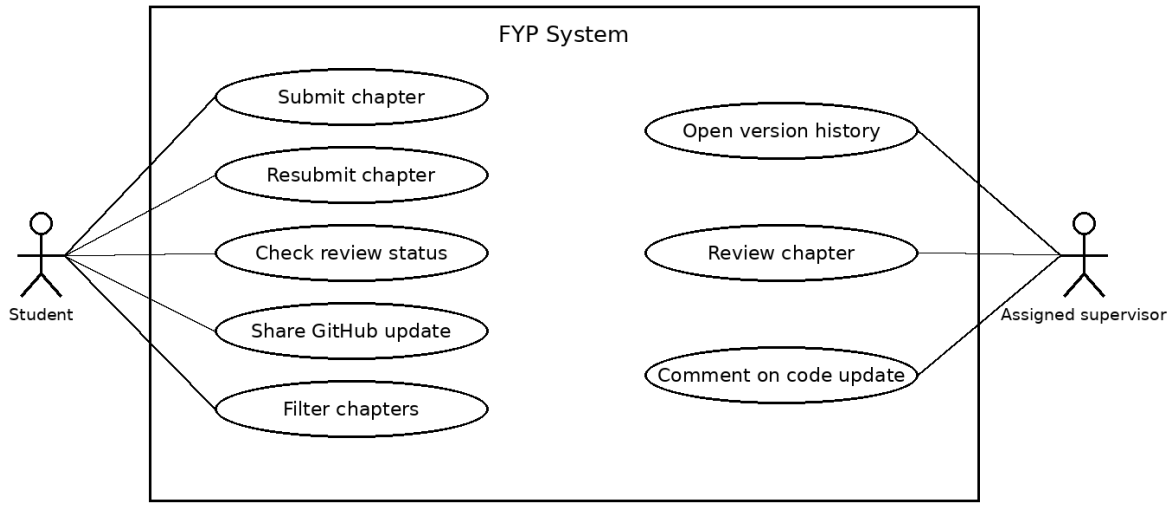
5. Use cases



UC-01 Submit a chapter

Actor. Student. Precondition. Signed in and assigned to a project.

Main flow. Select a chapter, upload a PDF or DOCX, and submit. The system validates the file and records version 1 with a timestamp.

Alternative flow. Unsupported, oversized or missing files are rejected and no version is created. If the chapter already exists, the student opens its history to resubmit when eligible.

Outcome. Version 1 is Submitted and visible to the assigned supervisor.

UC-02 Review a chapter

Actor. Assigned supervisor. Precondition. Signed in and assigned to the project. Its latest chapter version is Submitted.

Main flow. Open the latest version, read it, enter feedback and save a decision. The system stores the review against that version.

Alternative flow. If the version has already been reviewed or replaced, the system rejects the stale action and shows the current version. Empty feedback is rejected.

Outcome. The owner can see the decision and comments. Changes requested enables resubmission.

6. Traceability and release priorities

Concern	Requirement	Story	Test
PP-01 Travel and timing	FR-01	US-01	T-01 Version 1 appears with its submission timestamp.
PP-02 Version confusion	FR-02	US-02	T-02 Version 2 appears first and version 1 remains accessible.
PP-03 Feedback scattered across files	FR-03	US-03	T-03 The feedback and decision appear on that version.
PP-02 Version confusion	FR-04	US-04	T-04 Version 2 is Submitted and version 1 retains its feedback.
PP-04 Unclear review status	FR-05	US-05	T-05 The latest decision and its feedback are visible.
PP-05 GitHub link lacks context	FR-06	US-06	T-06 The supervisor sees both in the project updates list.
PP-05 GitHub link lacks context	FR-07	US-07	T-07 The student sees the comment beside that link.
PP-04 Unclear review status	FR-08	US-08	T-08 Only chapters with that status appear.

MoSCoW and delivery plan

Must. Session 4 covers submission, version history and review (8 points). Session 5 covers resubmission, review status and GitHub updates (8 points).

Should. Comment on GitHub updates (5 points). Could. Filter chapters by status (5 points). Won’t this release. Live chat, grading or GitHub synchronisation.
